```
api rails new OneBitContacts --api
```

Postman: <https://www.getpostman.com/>

Preparando nossa API

Gerando nossa Base de Dados

Esqueça o console

Como utilizar o Postman para adicionar um contato ao sistema

Versionando a API

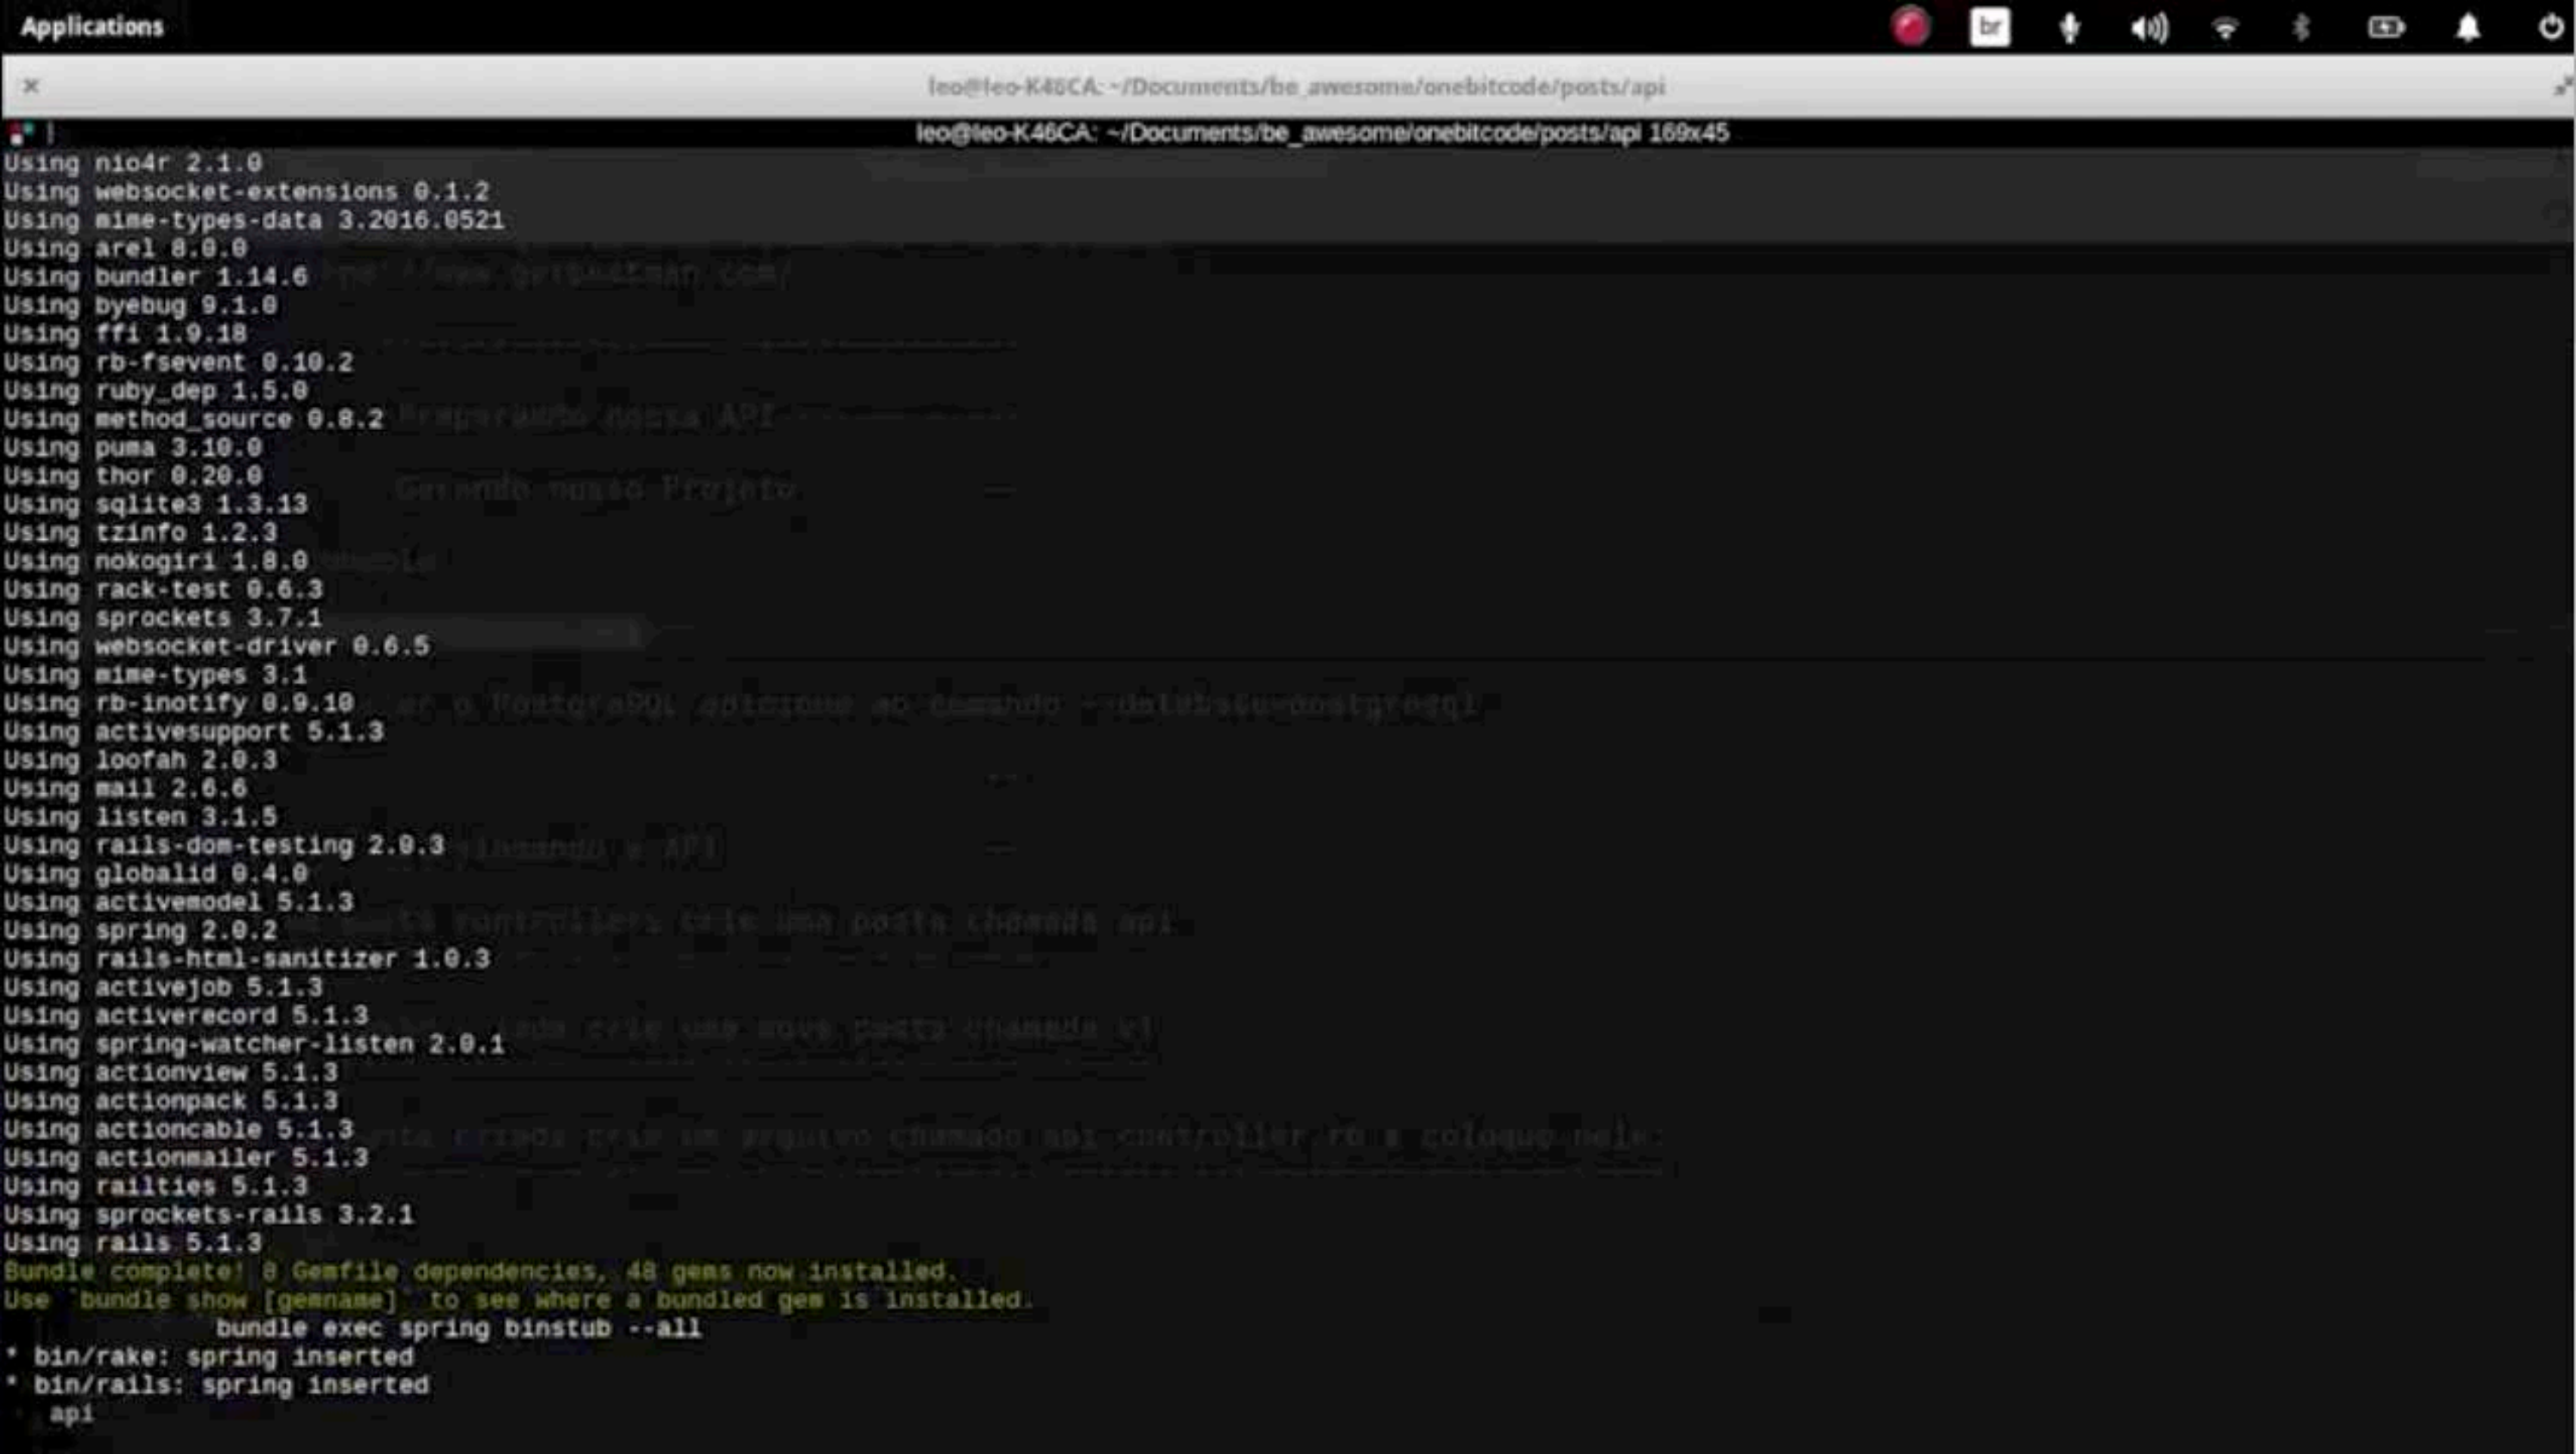

1 - Dentro da pasta controllers cria uma pasta chamada api

2 - Dentro da pasta api cria uma nova pasta chamada v1

3 - Dentro da pasta api cria um arquivo chamado api\_controller.rb e coloca o seguinte código:

```
module Api
  class ApiController < ApplicationController
    include ActionController::Base
  end
end
```

```
16 ----- Preparando nossa API -----
17
18 -- Gerando nosso Projeto --

Some setup you must do manually if you haven't yet:

1. Ensure you have defined default url options in your environments files. Here is an example of default\_url\_options appropriate for a development environment in config/environments/development.rb:

```
  config.action_mailer.default_url_options = { host: 'localhost', port: 3000 }
```

In production, :host should be set to the actual host of your application.

2. Ensure you have defined root\_url to "something" in your config/routes.rb. For example:

```
  root to: "home#index"
```

3. Ensure you have flash messages in app/views/layouts/application.html.erb. For example:

```
<p class="notice"><%= notice %></p>
<p class="alert"><%= alert %></p>
```

4. You can copy Devise views (for customization) to your app by running:

```
rails g devise:views
```

OneBitContacts git:(master) X

rails generate devise User

rails generate devise User 169x45

The image shows a code editor window with a dark theme. The title bar at the top reads "snippets [-/Documents/be\_awesome/onebitcode/posts/api]". Below the title bar is a search bar with "Find" and "Replace With" fields. The main editing area contains a text snippet with line numbers 146 through 178. The text is a mix of Portuguese and English, providing instructions for setting up authentication in a Rails application. The snippet includes commands for running migrations, adding gems, and installing dependencies. The text is as follows:

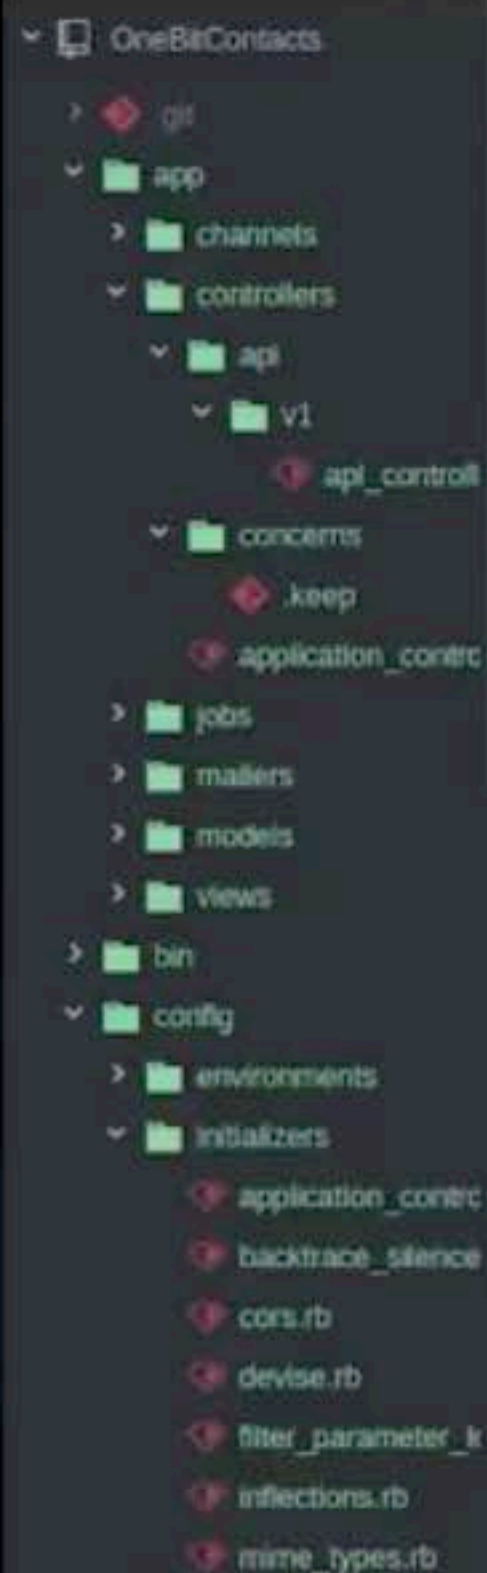

```
146
147 Gere as migrations:
148 -----
149

17 # Use Puma as the app server
18 gem 'puma', '~> 3.7'
19 # Build JSON APIs with ease. Read more: https://github.com/rails/jbuilder
20 # gem 'jbuilder', '~> 2.5'
21 # Use Redis adapter to run Action Cable in production
22 # gem 'redis', '~> 3.0'
23 # Use ActiveModel has_secure_password
24 # gem 'bcrypt', '~> 3.1.7'
25
26 # Use Capistrano for deployment
27 # gem 'capistrano-rails', group: :development
```

```
root to: "home#index"
```

3. Ensure you have flash messages in app/views/layouts/application.html.erb.  
For example:

```
<p class="notice"><%= notice %></p>
<p class="alert"><%= alert %></p>
```

4. You can copy Devise views (for customization) to your app by running:

```
rails g devise:views
```

```

The screenshot shows a macOS desktop environment. At the top, there is a menu bar with system status icons on the right and the 'Applications' menu on the left. Below the menu bar is a code editor window titled 'snippets (~/.Documents/be\_awesome/onebitcode/posts/api)'. The editor has a search bar on the left and a 'Replace With' field on the right. The main area of the editor displays a Ruby code snippet for implementing token authentication in a Rails application. The code includes comments in Portuguese and instructions for adding gems, installing dependencies, creating migrations, and setting up authentication logic in a controller. The line 'acts\_as\_token\_authenticatable' is highlighted. At the bottom of the screen is a dock containing icons for various applications, including a code editor, a web browser, and a file manager.

```
155 devise SimpleToken
156
157 Adicione ao seu Gemfile:
